

Elevate Business Capability Models With Pace-Layering

What is Pace-Layering?

BEST PRACTICES

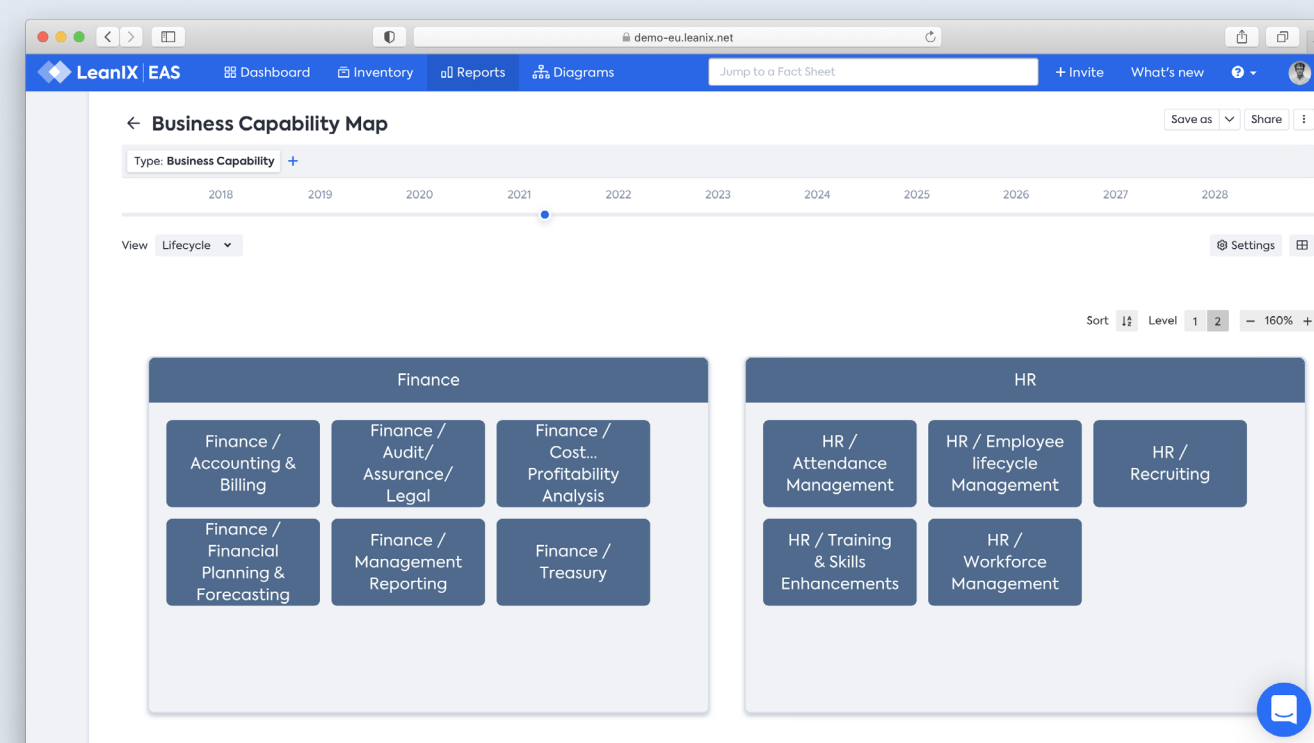

- Perform frequent impact analysis on systems of innovation
- Use pace-layered capability maps as a basis for bimodal strategies
- Promote configurability only in systems of differentiation and innovation
- Set consistent definitions and evaluation criteria to stakeholders when segmenting capabilities
- Apply pace-layers only after business capabilities are fully defined
- Re-assess business capabilities against future-state architectures
- Gauge IT investments with expertise from across departments to broaden the feedback loop
- Couple pace-layering models with centralized data on IT costs

Pace-Layering Steps

1

Develop Business Capability Maps

Develop business capability map with business and IT stakeholders

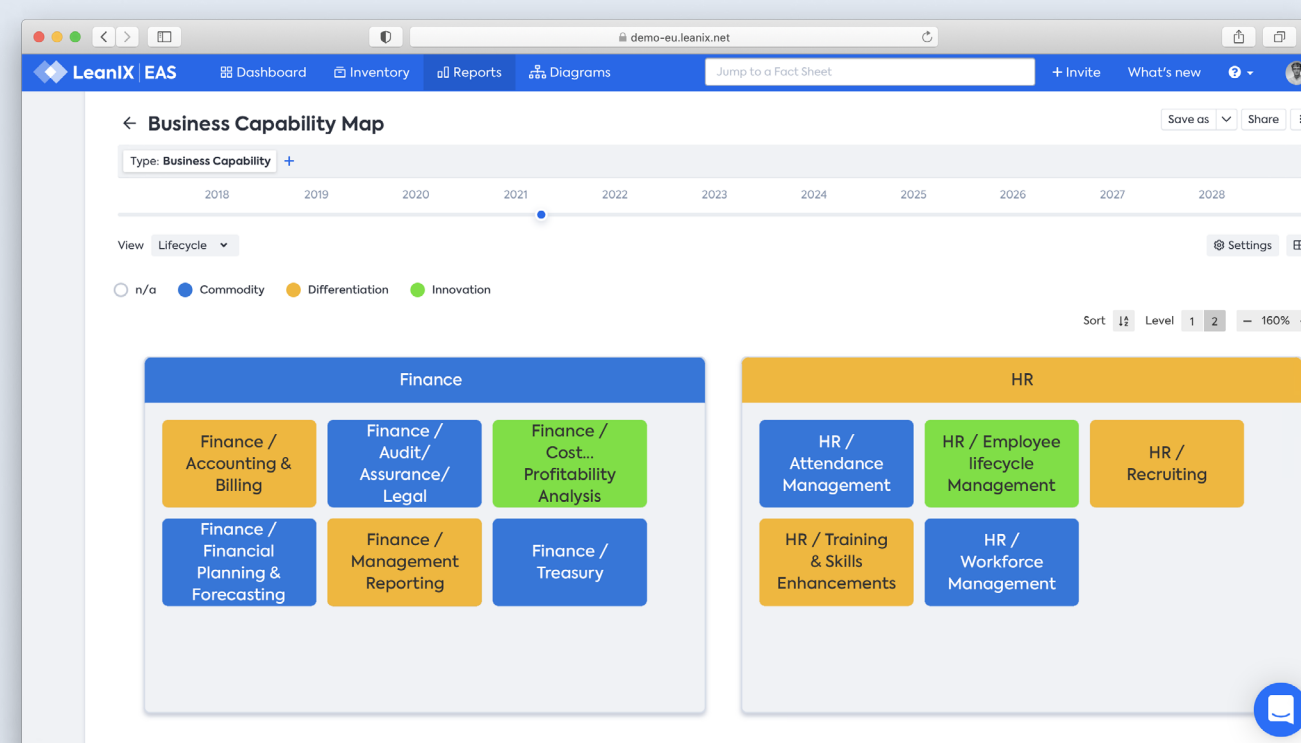

- Establish clear responsibilities with business and IT stakeholders
- Ensure first level of business capabilities reflect those most critical to operations
- Go no more than three levels down for each capability

2

Apply Pace-Layers

Segment business capability maps by commodity (common ideas), differentiation (better ideas), and innovation (new ideas)

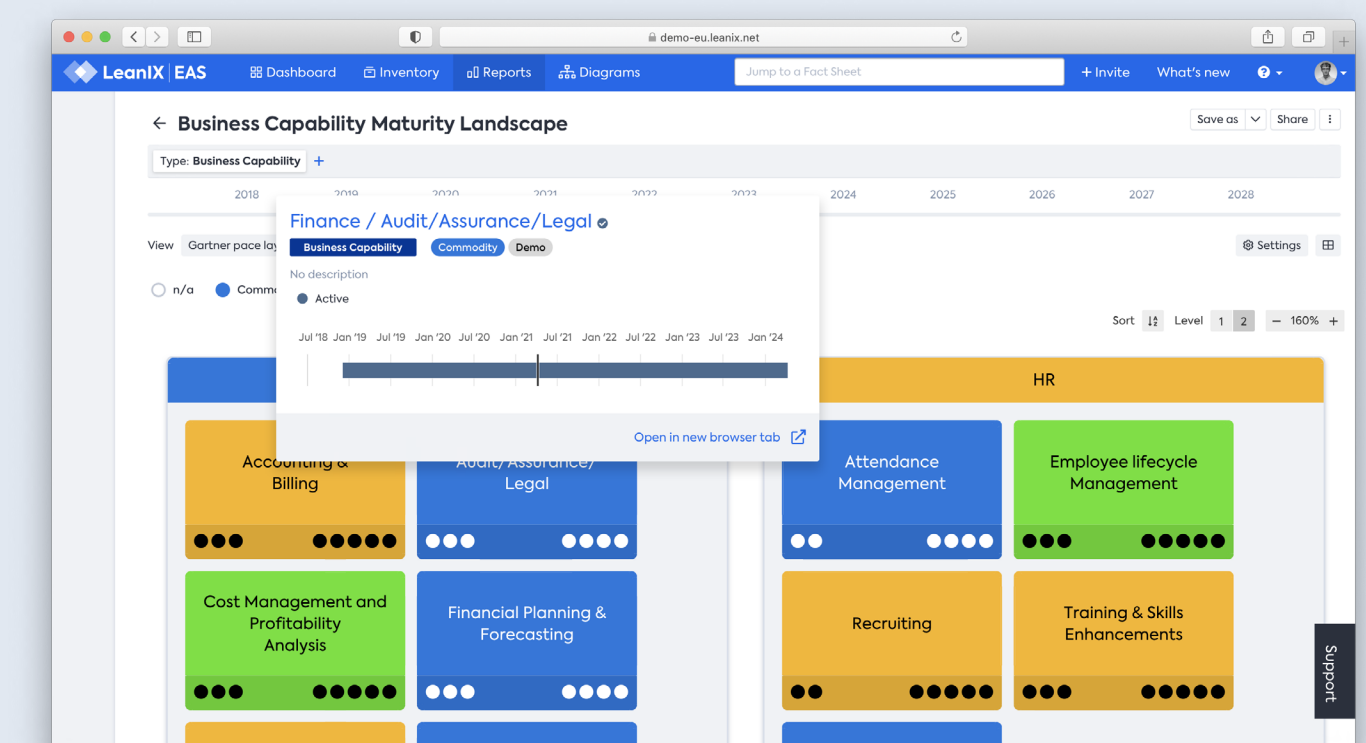

- Accommodate variations across business units, global regions, and user groups
- Use customized tags to categorize business capabilities
- Align which business capabilities serve as future differentiators and are subject for exploration

3

Scope Investments/Resources

Move discussions on IT investments from applications to business capabilities

- Distribute costs and governance efforts based on which areas of a business are prone to change; prioritize resources where needed
- Use business capability maturity scores to further visualize pace-layering
- Ensure business capabilities evolve in parallel to technology roadmaps
