

TimeXtender's Holistic Data Suite

“So many ways to customize and so many methods for transforming and connecting data.”

Built to offer the flexibility and scalability needed to address the dynamic and complex nature of today's data ecosystems.

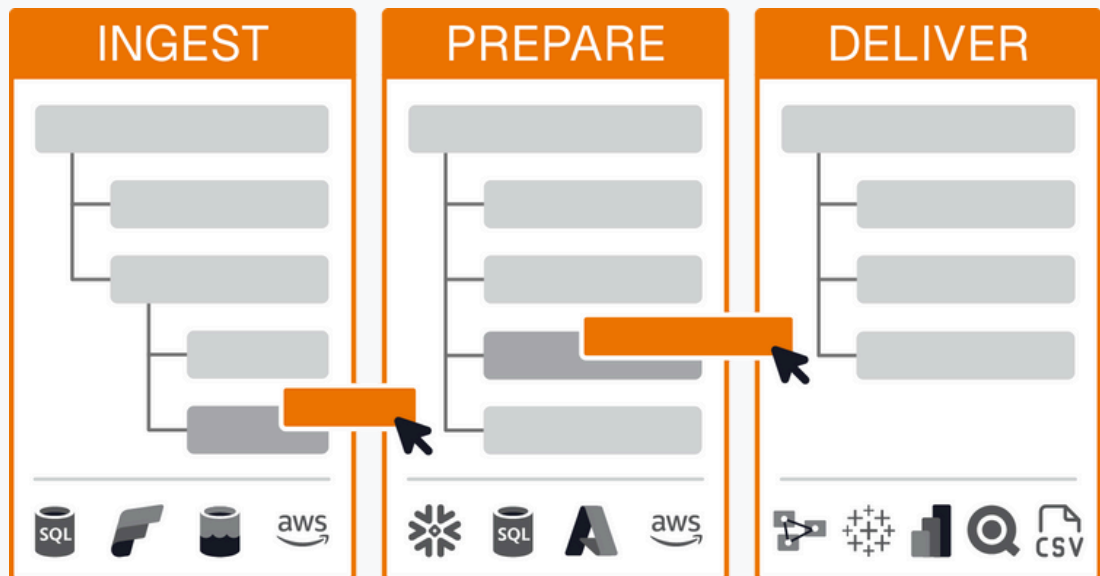

From automating data integration processes to applying stringent governance standards across all data assets, our comprehensive suite addresses the multifaceted challenges businesses face in managing their data effectively. 

Data Integration

Build a data infrastructure capable of ingesting, transforming, modeling, and delivering clean, reliable data.

By leveraging metadata to unify each layer of the data stack and automate manual processes, TimeXtender empowers you to ingest, prepare, and deliver business-ready data 10x faster, while reducing your costs by 70%-80%.

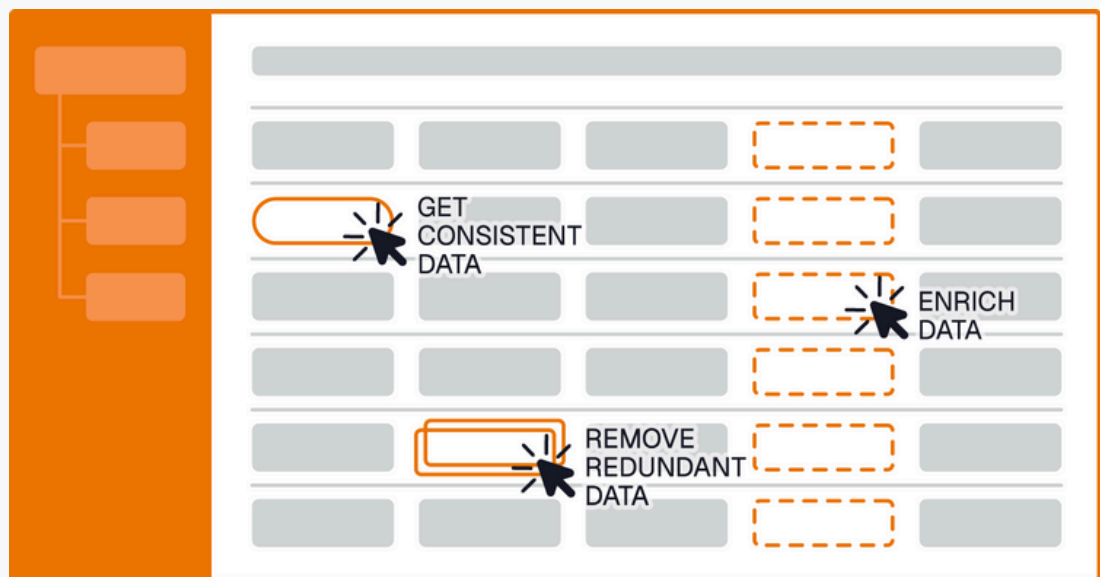

Our modular approach and cloud-based instances give you the freedom to build these components separately (a single data lake, for example), or all together as a complete and integrated data solution.

Master Data Management

Facilitates a comprehensive and cohesive approach to managing, synchronizing, and improving critical business data across diverse systems and departments.

An essential addition to our suite, the Master Data Management product allows our customers to ensure the uniformity, accuracy, and stewardship of core business data—such as customers, products, and vendors—across various systems.

Master Data Management operates independently, making it a versatile tool that can be implemented within any organization's existing data infrastructure.

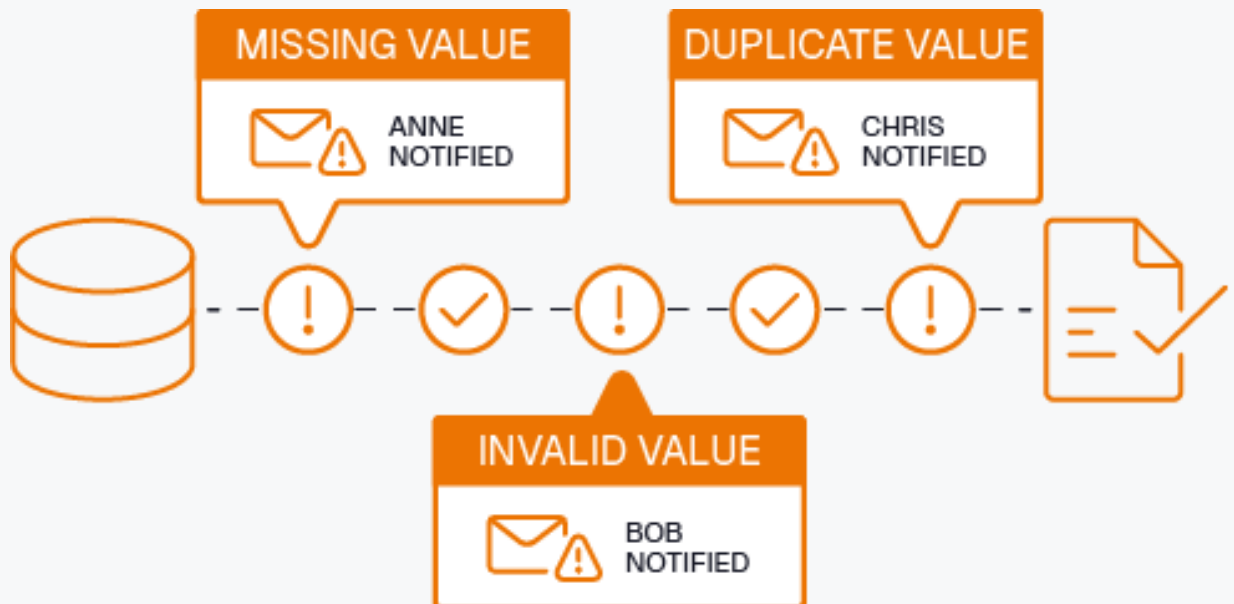

Data Quality

Establishes trust in data and enhances the accuracy of reports.

With this, users can take control of their data, ensuring that inaccurate or poor-quality data does not compromise business operations.

For advanced data quality capabilities across the organization—including data sources and repositories not directly managed by TimeXtender's Data Integration Product— Data Quality is available either as an add-on or as a separate product.

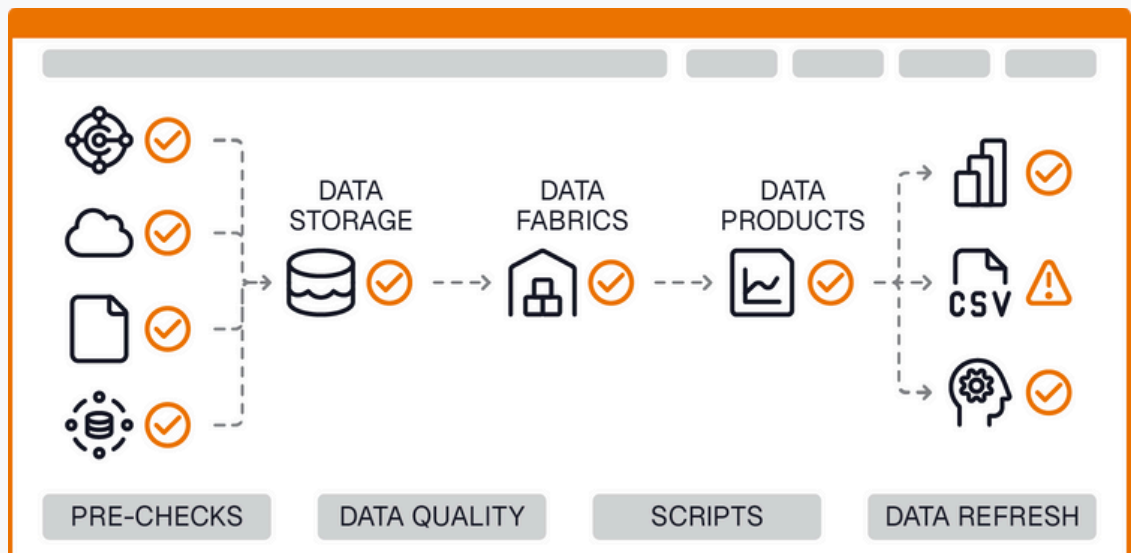

This ensures that our customers can maintain high-quality data standards across all their data assets.

Orchestration

Automates complex workflows, reducing manual errors and improving operational effectiveness. Its real-time monitoring capabilities enable swift issue detection and resolution, ensuring continuous workflow and system resilience.

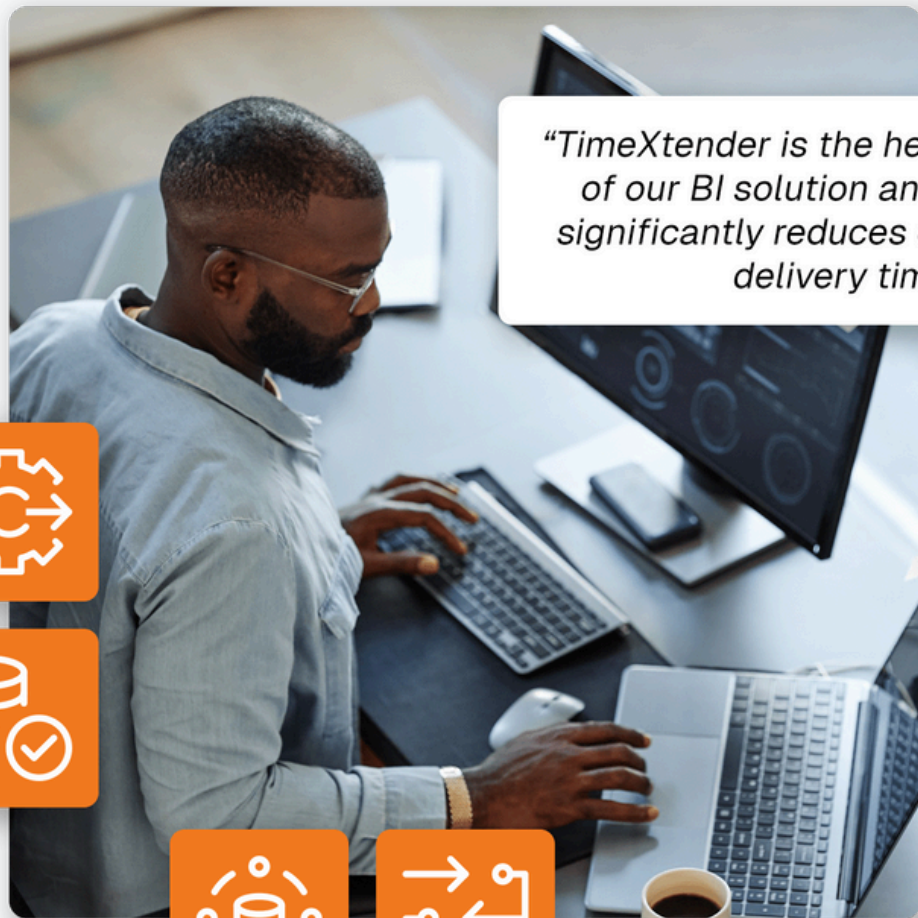

End-to-end orchestration is included in every TimeXtender package. However, for orchestrating organization-wide data processes and workflows that extend beyond TimeXtender's Data Integration Product, Orchestration is available for purchase as an add-on or standalone product.

This tool ensures that every step in your data journey—from ingestion to transformation to reporting—is executed efficiently, regardless of the systems and platforms involved.
