When logistics-tech company Quiqup set out to reinvent itself from an operator to a scalable platform connecting order sources, fulfillment centers, and delivery partners, CTO Danny Hawkins knew he needed a better foundation. The performance and developer experience of their existing tech stack (Ruby on Rails / Elixir) wasn't going to cut it. Then he discovered Encore.

I've always been striving for a developer platform where developers can self-serve secured infrastructure, and have used Helm and Crossplane to accomplish parts of it. But once I saw Encore, I realized: this is years ahead of what I had in my head.

Danny Hawkins, CTO at Quiqup

## The Problem: Developer velocity and DevOps burnout

As the company relocated to Dubai and shed its dedicated DevOps function, Danny as CTO found himself needing a new solution for managing infrastructure and DevOps.

On the engineering side, the team needed a performant, strongly typed language (hello Go), and a way to onboard developers quickly while minimizing setup pain.

Danny found that traditional Go frameworks lacked structure, and building a full-fledged internal developer platform (IDP) was out of scope.

## The Solution: Modular monolith, zero-maintenance infrastructure, and fast onboarding

Danny first experimented with Service Weaver, a modular monolith concept from Google, but found it underdeveloped and unsupported. That led him to Encore.

I loved the modular monolith concept. Microservices are too heavy to manage without a big team, and monoliths have their own issues. Encore was the perfect balance.

Danny Hawkins, CTO at Quip

Encore's opinionated structure, auto-provisioned infrastructure, and zero-config local dev made it a no-brainer:

You just run `encore run` and everything works. No bootstrapping pain. No database password headaches. Developers were up and running immediately.

Danny Hawkins, CTO at Quip

Quip started with a clean slate for its new platform, architected around three domains: fulfillment, logistics, and order channels. That architecture now includes:

- ~200 endpoints
- 30+ services
- 0 Dedicated DevOps engineers

We've built our platform very quickly. It just wouldn't have been possible without Encore.

Danny Hawkins, CTO at Quiqup

## Quantifiable impact: Developer experience and cost savings

Encore helped Quiqup slash the time it takes to onboard new developers and manage infrastructure.

If we were onboarding people onto Go without Encore, it would have taken 2–3x longer to get productive.

Danny Hawkins, CTO at Quiqup

Beyond productivity, Encore Cloud eliminated the need for a full DevOps team. Danny estimates Quiqup would've needed to hire 2 additional engineers dedicated to DevOps work. With Encore, 95%+ of DevOps tasks are automated and can be easily managed without any full-time DevOps engineers.

Not hiring dedicated DevOps engineers means saving \$180k per year. Using Encore is a no-brainer.

Danny Hawkins, CTO at Quiqup

## Developer tools that actually get used

Encore's built-in developer dashboard with service catalog, tracing, and logging made local development not just faster, but enjoyable.

With Encore's developer dashboard, my developers can actually see how the API works, view logs, and trace requests all without deploying anything. It's changed the

way we build APIs.

Danny Hawkins, CTO at Quiqup

## Minimal vendor lock-in, maximum flexibility

One common concern with developer platforms is lock-in. But Encore's `eject` feature and transparent use of Go helped put Danny's mind at ease.

Everything's structured in pure Go with a clean API layer. If we ever needed to leave, we could.

Danny Hawkins, CTO at Quiqup

He also pointed to Encore's open source roadmap and responsive Discord community as trust builders.

You support open source users like they're paying customers. You don't see that often.

Danny Hawkins, CTO at Quiqup

## Infrastructure that gets out of the way

Danny had previously built a custom Helm chart and hybrid deployment flow using Crossplane just to achieve some of what Encore provides out of the box.

Encore is exactly what I was trying to build, but years ahead, and I don't have to maintain any of it. The fact that developers can just spin up a database or add an object store is really, really, great. Encore handles everything: load balancers, SSL certs, IAM, the whole deal. But it's all still running in our own cloud, so we've got full visibility. We can see costs per SKU and everything. I honestly couldn't have imagined a better setup.

Danny Hawkins, CTO at Quiqup

## Final verdict

When asked to summarize his experience with Encore, Danny didn't hesitate:

It's made software development fun again. Honestly, that's what it's felt like. Encore lets us focus on delivering business value, not on all the garbage around it. It's one of the best decisions I've made as a CTO.

Danny Hawkins, CTO at Quiqup

## Key Takeaways

By using Encore Cloud to build and deploy their logistics platform to Google Cloud,

Quiqup have:

- Reduced DevOps workload by 95%
- Saved \$180k per year by not needing dedicated DevOps engineers
- Improved developer onboarding speed by 2-3x

**Want results like Quiqup?** [Book a 1:1 intro](#) to see how Encore Cloud can help your team move faster, save big, and stay focused on building great products.
