GLOBAL GOALS

In our ever-changing world, technology and how we connect with others both play a major part. AONMeetings makes connecting SIMPLE. We offer a product that doesn't require apps to download, or users to perform software updates prior to use. AONMeetings uses WebRTC (Web Real-Time Communication) which streamlines browser-based communication.

OUR SERVICES

AONMeetings is committed to offering features and services that the competition requires as add-ons or not at all. Whether you are meeting with a few clients, or presenting a webinar for the whole company, AON Meetings can provide **custom** *solutions for you.*

Enterprise packages available. Inquire at:
info@aonmeetings.com

- AON Meetings is browser based. That means time-saving convenience for ever-busy users. There is no app to update.
- Webinar/ClassRoom meetings are available at no extra charge. On competing video conferencing platforms, this feature would be an add-on, with additional fees.
- Through AONMeetings, you have the luxury and ability to host Webinar Events with paid registration. Have an event you want to charge for registration? At AONMeetings, you can take attendee registration payments directly on the site.

SECURITY

FOR PEACE OF MIND

1. End-to-end encrypted (E2EE) video conferencing
E2EE ensures privacy between all parties in the AONMeetings software. Encryption takes data and scrambles it so that anyone without the key to unlock the data cannot view it. E2EE covers every aspect of the service, from the underlying infrastructure to the security of conference rooms, cameras, and microphones (media), call setup (signaling) and any other endpoints accessed by users.

2. Security Codes and One-Time Access Codes
Add a Security Code to your meeting if you're discussing highly sensitive information. Access permission is granted to participants with the code upon entering a conference.

3. Secure Real-Time Protocol (SRTP)
SRTP protects real-time streaming data, such as audio and video, encrypting data and authenticating messages within the video conferencing solution.

4. Camera and microphone access
AONMeetings has the ability to restrict access to camera and microphone devices. You know you have a secure video chat when the user's web browser requires their explicit permission before it will access their microphone and camera.

5. WebSockets
This security protocol protects the telecommunication signaling channels that allow the videoconference to call end-users and allow them into the chat room.

6. User meeting security controls
Secure video teleconferences allow the person conducting the meeting to apply additional security controls as an added layer beyond the security infrastructure.

7. The video conference account should also be secure
Account information is secured and requires authentication from the end-user.

8. Look for HIPAA compliance
HIPAA is a stringent federal compliance rule that secures the protected health information (PHI) of patients. Our video conferencing solution is HIPAA-compliant.
