Challenge

A lean IT team struggled to manage a mixed fleet of macOS, Windows, and Linux devices across 27 different states.

Manual management of 4,000+ distributed users created security risks and stifled the company's rapid growth.

Solution

Partner NetNxt deployed JumpCloud's open directory to centralize all identities and devices into a single, OS-agnostic console.

Enforced rigorous access controls via Single Sign-On (SSO) and Cloud RADIUS, instantly securing Wi-Fi and critical data for the entire remote workforce.

Impact

Automation allowed a small 4-person IT team to successfully support a workforce of 4,000+ without adding headcount.

Hardened the organization's security posture to meet the rigorous Fin-Tech compliance standards required for their future IPO.
