

Innovative Infrastructure

Addigy is a cloud-based Apple Device Management platform that enables Apple IT as a Service. Leveraging a modern technology stack and highly-scalable infrastructure, Addigy provides all the functionality you need to effectively manage your entire Apple ecosystem in a single, unified solution. No more one-off tools or incomplete point solutions. And because Addigy is cloud-based, there is no need to setup and maintain servers across locations.

Elevating the Apple IT Ecosystem

Powerful Administrative Framework

The Addigy platform allows virtually any web browser to securely and centrally access all administrative functions for servicing and managing Apple devices. From a single interface, Addigy users can perform powerful administrative tasks at scale with push button simplicity.

Live device access & management

Addigy has multiple remote control options that can be used within the main web application. Apple administrators can leverage Screen Connect, Addigy Remote Control, GoLive™, or the Addigy Live Terminal™ for real-time command-line access to managed devices regardless of geographic location.

Real-time monitoring with automated remediation

Addigy provides real-time device statistics across an entire portfolio giving Apple administrators complete visibility and powerful tools to manage the state of devices. Administrators can also monitor the state of machines and automatically trigger remediation steps if certain conditions are met. This robust and innovative solution allows Apple administrators to scale their time efficiently and effectively while providing unparalleled services to their users.

“ It’s such a joy to be able to just push out an application to a user when they aren’t looking. I had a user recently that couldn’t launch Chrome, so I deleted the current version with Addigy Live Terminal, pushed out the new version from Deployments, and then asked the user to click the Chrome icon in their dock. All in real-time it took under a minute and the user was back in business.

- Tim Pearson, Partner, **CreativeTechs**

Profile Management and Deployment

Touchless DEP Deployment

Hardware Inventory

Self Service Catalog

Apple VPP Support

100% Cloud Architecture

Easy OS and software deployment & updating

With Addigy, there is no need to create and upload custom packages for every piece of software you support. Addigy has an extensive public software catalog regularly updated by our team and the Addigy community. Administrators can deploy custom or public software, configuration profiles, applications and patches to their entire portfolio all from within the web application. We also remove the cumbersome task of manually uploading items to separate distribution points and provide real-time deployment status to deliver greater flexibility and visibility to users.

Administrators can also automatically apply system updates, Microsoft Office updates and third-party patches, as well as provide software, services and solutions through the End-User Self Service

Profile and device configuration & governance

Maintaining the desired configuration state of every Apple device in a portfolio is a mission critical task. Apple administrators who use Addigy can ensure that all device profiles and configurations are enforced across their entire portfolio at all times.

Organization-wide security & compliance enforcement

Apple IT administrators play a critical role in securing Apple devices and ensuring they remain compliant with any organizational security policies. Administrators can use Addigy to make sure all security configurations are enforced at a department or organization level. Security features include Firewall Management, Website Blocking, Filevault Management, Gatekeeper Enforcement, Password Policy Enforcement, Screensaver Password Settings, Extensive Security Software Catalog and more.
